1.2 Introduction

1.2.1 What is g2 ?

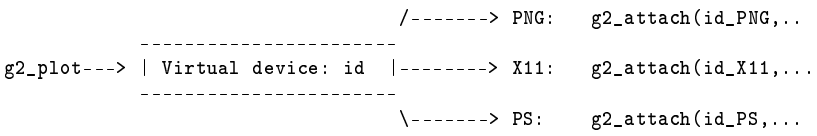
1.2.1.1 Short version (if you are in hurry)

- 2D graphics library
- Simple to use
- Supports several types of output devices (currently X11, PostScript, devices supported by `gd` (PNG, JPEG), `FIG` and MS Windows windows)
- Concept allows easy implementation of new device types
- Virtual devices allow to send output simultaneously to several devices
- User definable coordinate system
- Written in ANSI-C
- Tested under Digital Unix, AIX, Linux, VMS and Windows NT
- Perl support
- Python support

- Fortran interface

1.2.1.2 Long version

g2 is a simple to use graphics library for 2D graphical applications written in Ansi-C. It provides a comprehensive set of functions for simultaneous generation of graphical output on different types of devices. Currently, the following devices are supported by g2: X11, PostScript, `gd` (PNG and JPEG), `FIG` and MSăWindows. One major feature of the g2 library is the concept of virtual devices. An arbitrary number of physical devices (such as PostScript or X11) can be grouped to create a so-called virtual device. Commands sent to such a virtual device are automatically issued to all attached physical devices. This allows for example simultaneous output to a PNG file and a PostScript file. A virtual device in turn can be attached to another virtual device, allowing to construct trees of devices. Virtual devices can also be useful when using different user-coordinate systems. E.g. one X11 window showing an overview of a graphical output, and a second window showing a zoom of a more detailed area of the graphic. Drawing in both windows is performed by one single command to the virtual device.



If you don't need or like the concept of virtual devices, simply ignore it.

1.3 Getting Started

1.3.1 Preinstallation tasks:

PNG and JPEG support

g2 uses the gd library by Thomas Boutell to generate PNG and JPEG files. This package is freeware (however, not GPL) and can be downloaded at `http://www.boutell.com/gd/`. Linux users might prefer to install a pre-compiled gd rpm package which should be available at your local RedHat mirror site. NT users should install the gd source package in a subdirectory named "gd" which should be located in the same directory as the g2 subdirectory (but not in the g2 directory itself). Otherwise, file locations for gd must be modified in the g2 project workspace. Unix and VMS users will have to build and install gd according to the instructions found in the gd distribution.

1.3.2 Installation

1.3.2.1 Linux

1. Either install RPM packet with binaries, or compile as described in the **Unix**(p. 2) section

1.3.2.2 Unix

1. Extract package with `gzip -dc g2-xxxx.tar.gz | tar xvf -`
2. Run `./configure`

3. Optionally run `make depend`
4. Run `make`
5. Run `make install`, or copy libg2.a/so and **g2.h**(p. ??), **g2_X11.h**(p. ??), **g2_PS.h**(p. ??), **g2_gd.h**(p. ??) and **g2_FIG.h**(p. ??) to the default locations for library and include files
6. Optionally `cd` to demo directory and run `make`

1.3.2.3 Windows NT

1. Extract package using either the .tar.gz or the .zip distribution
2. MS Visual C++ users can build both library and demos with the supplied project file: g2.dsw (to obtain an icon and use menu functions, you must also build the g2res project in g2.dsw)
3. Users of gcc or other commandline based compilers with make support continue as in **Unix**(p. 2) example
4. It is also possible to compile g2 on winNT/95 using the free cygwin32 library and a X-windows library for Windows. Theoretically it should be possible to support both X-windows and native NT/95 windows at the same time.

1.3.2.4 Perl (old instructions)

1. Change to directory g2_perl
2. Perform following steps
   - `perl Makefile.PL`
   - `make`
   - `make test`
   - `make install`
3. See the **Perl interface**(p. 6) section for more information

1.3.2.5 Python

1. Make sure you have Python installed (note: SWIG is **not** needed)
2. Build g2 as described above (see **Installation**(p. 2))
3. Change to directory g2_python
4. Type
   - on Linux:
     - `make` to build g2 Python module
     - `make demo` to test g2 Python module
     - `make install` to install g2 Python module (you must be **root**)
   - on Windows (you need Visual Studio when using the standard Python release for Windows):
     - `setup.py "compile options" "link options" install`

5. If you link your g2 Python module against `libg2.so`, and you are unwilling or unable to do an install, you need to tell the g2 Python module where to look for it, either with `ldconfig`, or with the `LD_LIBRARY_PATH` environment variable

6. See the **Python interface**(p. 6) section for more information

1.3.2.6 VMS

1. Try to extract either the .tar.gz or the .zip distribution (whatever is easier for you)

2. Type `mms` to compile library (descrip.mms file is supplied)

3. Run `mms` in demo directory to compile demo applications

1.3.3 A simple example

The following example is a minimal application. It draws a rectangle in a PostScript file.

```
#include <g2.h>
#include <g2_PS.h>

main()
{
    int id;
    id = g2_open_PS("rect.ps", g2_A4, g2_PS_land);
    g2_rectangle(id, 20, 20, 150, 150);
    g2_close(id);
}
```

- Always include <**g2.h**(p. ??)>. Additionally include header files for all types of devices you want to use.

- Open devices using g2_open_XY functions.

  The open function returns a device id of type int, which you need to refer to the device.

- Call **g2_close()**(p. 21) to close device.

- Consider turning off auto flush (**g2_set_auto_flush()**(p. 21)) for improved performance.

You want to draw a PNG file instead of a PostScript file ? Replace the PS header file with

```
#include <g2_gd.h>
```

and replace the call to **g2_open_PS()**(p. 34) with

```
id = g2_open_gd("rect.png", 300, 200, g2_gd_png);
```

You want to draw to a PNG file and a PostScript file with one plot command ?

Here we use the concept of virtual devices. Open a PNG and a PostScript device, then open a virtual device and attach both the PNG and PostScript device to the virtual device. Plot commands to the virtual device will be issued to both the PNG and the PostScript device. You can attach and detach further devices at any time.

```
#include <g2.h>
#include <g2_PS.h>
#include <g2_gd.h>

main()
{
    int id_PS,id_PNG,id;

    id_PS  = g2_open_PS("rect.ps", g2_A4, g2_PS_land);
    id_PNG = g2_open_gd("rect.png", 300, 200, g2_gd_png);
    id     = g2_open_vd();

    g2_attach(id, id_PS);
    g2_attach(id, id_PNG);

    g2_rectangle(id, 20, 20, 150, 150);
    g2_circle(id, 50, 60, 100);

    g2_close(id);
}
```

Note: closing a virtual device automatically closes all attached devices.

1.3.3.1 More examples

More examples showing the usage of different user coordinate systems, multiple virtual devices, splines, etc. can be found in the distribution (demo directory).

1.3.4 Fortran interface

The Fortran interface for g2 has currently been tested on Linux and Digital Unix/OSF. Function names for Fortran are the same as in C, however the following differences exist:

- All variables, including device IDs, are of type `REAL`
- Void functions are implemented as subroutines and must be called with `CALL`
- Constants defined by `#define` in C (e.g. **g2_A4**(p. 32)) do not work. Get corresponding values from the appropriate header files.

A short Fortran example:

```
program demo
real d,color
d=g2_open_PS('demo_f.ps', 4.0, 1.0)
call g2_plot(d, 50.0, 50.0)
call g2_string(d, 25.0, 75.0, 'TEST ')
color=g2_ink(d, 1.0, 0.0, 0.0)
write (6,*) color
call g2_pen(d, color)
call g2_circle(d, 20.0, 20.0, 10.0)
call g2_flush(d)
call g2_close(d)
stop
end
```

1.3.5 Perl interface (old info)

The Perl interface for g2 has currently been tested on Linux and Digital Unix/OSF. Function names in Perl are the same as in C, however the device itself is implemented object oriented, i.e. the device argument is omitted in all functions. Cf. the following simple Perl script:

```
use G2;

$d = newX11 G2::Device(100,100);
$d->circle(10, 10, 20);
$d->string(20, 40, "Hello World");

print "\nDone.\n[Enter]\n";
getc(STDIN);

$d->close()
```

The creator functions are `newX11`, `newGIF`, `newPS`, etc. and accept the same arguments as the open functions in the C version. See the Perl documentation (`perldoc G2`) for more details and the test.pl script for a more extensive example.

1.3.6 Python interface

Function names in Python are the same as in C, however the device itself is implemented object oriented, i.e. the device argument is omitted in all methods. An object is instantiated with one of the `g2_open_` functions. Here is a simple Python script:

```
import sys
from g2 import *
X11 = g2_open_X11(822, 575)
PS = g2_open_PS('foo.ps', g2_A4, g2_PS_land)
graph = g2_open_vd()
graph.g2_attach(X11)
graph.g2_attach(PS)
graph.g2_line(30, 30, 90, 90)
graph.g2_circle(60, 60, 30)
X11.g2_pen(X11.g2_ink(.75, .2, 0))
graph.g2_polygon([60, 30, 30, 60, 60, 90, 90, 60])
graph.g2_set_dash([20, 12])
sqrts = [100, 100, 225, 150, 400, 200, 625, 250]
graph.g2_poly_line(sqrts)
graph.g2_image(640, 252, [[2, 4, 6],[3, 6, 9],[4, 8, 12]])
graph.g2_flush()
print 'Done.\n[Enter]'
sys.stdin.read(1)
graph.g2_close()
```

In C, many functions expect a pointer to a buffer of `double`'s and an `int` stating the number of points in this buffer. In Python, these functions are passed just a list of `floats`. You need not specify the number of points: Python knows the length of the list.

Full documentation, including sample code, is available from the interactive Python prompt:

```
$ python
>>> import g2
>>> help(g2)
```

Here functions with a Python specific form (e.g. **g2_query_pointer()**(p. 19)) are marked as such.

g2 Module Documentation

4.1 FIG

Functions

- G2L int **g2_open_FIG** (const char *file_name)

4.1.1 Detailed Description

FIG devices generate output in the FIG 3.2 format. For more details about FIG format and xfig application please visit `http://www.xfig.org` .

Note:
FIG is a vector-oriented (as oposed to pixel-oriented) format. Therefore **g2_image**(p. 26) function and splines are not optimally supported.

4.1.2 Function Documentation

4.1.2.1 G2L int g2_open_FIG (const char * *file_name*)

Create a FIG device. g2 uses A4 paper size (landscape orientation) as default.

Parameters:
file_name fig file name

Returns:
physical device id

4.2 splines

Functions

- void **g2_spline** (int dev, int n, double *points, int o)
- void **g2_filled_spline** (int dev, int n, double *points, int o)
- void **g2_b_spline** (int dev, int n, double *points, int o)
- void **g2_filled_b_spline** (int dev, int n, double *points, int o)
- void **g2_raspln** (int dev, int n, double *points, double tn)
- void **g2_filled_raspln** (int dev, int n, double *points, double tn)
- void **g2_para_3** (int dev, int n, double *points)
- void **g2_filled_para_3** (int dev, int n, double *points)
- void **g2_para_5** (int dev, int n, double *points)
- void **g2_filled_para_5** (int dev, int n, double *points)

4.2.1 Function Documentation

4.2.1.1 void g2_b_spline (int *dev*, int *n*, double * *points*, int *o*)

Plot a b-spline curve with *o* interpolated points per data point. So the larger *o*, the more fluent the curve. For most averaging purposes, this is the right spline.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of *n* data points x1, y1, ... x*n*, y*n*

o number of interpolated points per data point

4.2.1.2 void g2_filled_b_spline (int *dev*, int *n*, double * *points*, int *o*)

Plot a filled b-spline curve with *o* interpolated points per data point. So the larger *o*, the more fluent the curve. For most averaging purposes, this is the right spline.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of *n* data points x1, y1, ... x*n*, y*n*

o number of interpolated points per data point

4.2.1.3 void g2_filled_para_3 (int *dev*, int *n*, double * *points*)

Using Newton's Divided Differences method, plot a filled piecewise parametric interpolation polynomial of degree 3 through the given data points.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of *n* data points x1, y1, ... x*n*, y*n*

4.2.1.4 void g2_filled_para_5 (int *dev*, int *n*, double * *points*)

Using Newton's Divided Differences method, plot a filled piecewise parametric interpolation polynomial of degree 5 through the given data points.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of n data points x1, y1, ... xn, yn

4.2.1.5 void g2_filled_raspln (int *dev*, int *n*, double * *points*, double *tn*)

Plot a filled piecewise cubic polynomial with adjustable roundness through the given data points. Each Hermite polynomial between two data points is made up of 40 lines. Tension factor *tn* must be between 0.0 (very rounded) and 2.0 (not rounded at all, i.e. essentially a **polyline**(p. 28)).

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of n data points x1, y1, ... xn, yn

tn tension factor in the range [0.0, 2.0]

4.2.1.6 void g2_filled_spline (int *dev*, int *n*, double * *points*, int *o*)

Using Young's method of successive over-relaxation, plot a filled spline curve with o interpolated points per data point. So the larger o, the more fluent the curve.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of n data points x1, y1, ... xn, yn

o number of interpolated points per data point

4.2.1.7 void g2_para_3 (int *dev*, int *n*, double * *points*)

Using Newton's Divided Differences method, plot a piecewise parametric interpolation polynomial of degree 3 through the given data points.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of n data points x1, y1, ... xn, yn

4.2.1.8 void g2_para_5 (int *dev*, int *n*, double * *points*)

Using Newton's Divided Differences method, plot a piecewise parametric interpolation polynomial of degree 5 through the given data points.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of *n* data points x1, y1, ... x*n*, y*n*

4.2.1.9 void g2_raspln (int *dev*, int *n*, double * *points*, double *tn*)

Plot a piecewise cubic polynomial with adjustable roundness through the given data points. Each Hermite polynomial between two data points is made up of 40 lines. Tension factor *tn* must be between 0.0 (very rounded) and 2.0 (not rounded at all, i.e. essentially a **polyline**(p. 28)).

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of *n* data points x1, y1, ... x*n*, y*n*

tn tension factor in the range [0.0, 2.0]

4.2.1.10 void g2_spline (int *dev*, int *n*, double * *points*, int *o*)

Using Young's method of successive over-relaxation, plot a spline curve with *o* interpolated points per data point. So the larger *o*, the more fluent the curve.

Parameters:

dev device id

n number of data points (not the size of buffer *points*)

points buffer of *n* data points x1, y1, ... x*n*, y*n*

o number of interpolated points per data point

4.3 color manipulations

Functions

- void **g2_pen** (int dev, int color)
- void **g2_set_background** (int dev, int color)
- int **g2_ink** (int pd_dev, double red, double green, double blue)
- void **g2_reset_palette** (int dev)
- void **g2_clear_palette** (int dev)
- void **g2_allocate_basic_colors** (int dev)

4.3.1 Detailed Description

The color concept used in the g2 library is inspired by Sir Clive Sinclair solution implemented in the ZX Spectrum computer. With the **g2_pen()**(p. 18) function it is possible to choose a pen created by the **g2_ink()**(p. 18) function. Note that g2_ink function is only defined for physical devices. The predefined colors (see g2_test demo program) have pens from 0 till 26 (inclusive).

Some basic colors are:

- 0 white
- 1 black
- 3 blue
- 7 green
- 19 red
- 25 yellow

4.3.2 Function Documentation

4.3.2.1 void g2_allocate_basic_colors (int *dev*)

Allocate basic colors

Parameters:
dev device

4.3.2.2 void g2_clear_palette (int *dev*)

Remove all inks.

Parameters:
dev device

4.3.2.3 int g2_ink (int *pd_dev*, double *red*, double *green*, double *blue*)

Create an ink. To put ink into the pen use **g2_pen()**(p. 18).

Parameters:

pd_dev physical device

red red component (0-1) according to the RGB color model

green green component (0-1) according to the RGB color model

blue blue component (0-1) according to the RGB color model

Returns:

new pen, see **g2_pen()**(p. 18)

4.3.2.4 void g2_pen (int *dev*, int *color*)

Set pen color for all following operations, see also **g2_ink()**(p. 18).

Parameters:

dev device

color pen (either one of default pens 0-26, or a pen returned by **g2_ink()**(p. 18))

4.3.2.5 void g2_reset_palette (int *dev*)

Clear collor palette (remove all inks) and reallocate basic colors.

Parameters:

dev device

4.3.2.6 void g2_set_background (int *dev*, int *color*)

Set the background color

Parameters:

dev device

color pen (either one of default pens 0-26, or a pen returned by **g2_ink()**(p. 18))

4.4 output control

Functions

- void **g2_flush** (int dev)
- void **g2_save** (int dev)
- void **g2_clear** (int dev)
- void **g2_set_font_size** (int dev, double size)
- void **g2_set_line_width** (int dev, double w)
- void **g2_set_dash** (int dev, int N, double *dashes)
- void **g2_set_QP** (int dev, double d, enum QPshape shape)
- void **g2_query_pointer** (int dev, double *x, double *y, unsigned int *button)
- void **g2_get_pd_handles** (int pd, void *handles[G2_PD_HANDLES_SIZE])

4.4.1 Function Documentation

4.4.1.1 void g2_clear (int *dev*)

Clear device

Parameters:

dev device number

4.4.1.2 void g2_flush (int *dev*)

Flush output buffers.

Parameters:

dev device id

4.4.1.3 void g2_get_pd_handles (int *pd*, void * *handles*[G2_PD_HANDLES_SIZE])

Get pointers to physical device specific handles. This function should be used only if you are familiar with the g2 source code. For details see physical device source code (e.g. in src/X11/). Example usage can be found in demo/handles.c.

Parameters:

pd physical device

handles returns pointers to physical device low level handles

4.4.1.4 void g2_query_pointer (int *dev*, double * *x*, double * *y*, unsigned int * *button*)

Query pointer (e.g. mouse for X11) position and button state. See the demo program pointer.c for an example.

Parameters:

dev device

x returns pointer x coordinate

y returns pointer y coordinate

button returns button state

4.4.1.5 void g2_save (int *dev*)

Save output

Parameters:

dev device id

4.4.1.6 void g2_set_dash (int *dev*, int *N*, double * *dashes*)

Set line dash. Set *N* to 0 and *dashes* to NULL to restore solid line.

Parameters:

dev device

N number of dash components (0 for solid line)

dashes vector of dash lengths (black, white, black, ...)

4.4.1.7 void g2_set_font_size (int *dev*, double *size*)

Set font size

Parameters:

dev device

size new font size

4.4.1.8 void g2_set_line_width (int *dev*, double *w*)

Set line width.

Parameters:

dev device

w new line width

4.4.1.9 void g2_set_QP (int *dev*, double *d*, enum QPshape *shape*)

Set QuasiPixel size and shape.

Parameters:

dev device

d size

shape shape (rectangle or circle, see QPshape)

4.5 devices control

Functions

- void **g2_close** (int dev)
- void **g2_set_auto_flush** (int dev, int on_off)
- void **g2_set_coordinate_system** (int dev, double x_origin, double y_origin, double x_mul, double y_mul)
- int **g2_ld** (void)
- void **g2_set_ld** (int dev)

4.5.1 Function Documentation

4.5.1.1 void g2_close (int *dev*)

Close and delete a device.

Parameters:

dev device

4.5.1.2 int g2_ld (void)

Get the last accessed device. G2LD macro is defined as the g2_ld function.

```
g2_open_X11(100, 100);
g2_plot(G2LD, 50, 50);
```

4.5.1.3 void g2_set_auto_flush (int *dev*, int *on_ off*)

Set auto flush mode for device *dev*. Auto flush mode means that after each graphical operation g2 library automatically calls flush function to ensure that output is realy displayed. However, freqent flushing decreases performance. Alternative is to flush output when needed by calling g2_flush function.

Parameters:

dev device

on_ off 1-on 0-off

4.5.1.4 void g2_set_coordinate_system (int *dev*, double *x_ origin*, double *y_ origin*, double *x_ mul*, double *y_ mul*)

Set the user coordinate system.

Parameters:

dev device

x_ origin x coordinate of the new origin (expressed in the default coordinate system)

y_ origin x coordinate of the new origin (expressed in the default coordinate system)

x_ mul x scaling factor

y_ mul y scaling factor

4.5.1.5 void g2_set_ld (int *dev*)

Set the last accessed device. See also **g2_ld()**(p. 21) function.

Parameters:

dev device

4.6 graphical output

Modules

- **splines**

Functions

- void **g2_move** (int dev, double x, double y)
- void **g2_move_r** (int dev, double dx, double dy)
- void **g2_plot** (int dev, double x, double y)
- void **g2_plot_r** (int dev, double rx, double ry)
- void **g2_line** (int dev, double x1, double y1, double x2, double y2)
- void **g2_line_r** (int dev, double dx, double dy)
- void **g2_line_to** (int dev, double x, double y)
- void **g2_poly_line** (int dev, int N_pt, double *points)
- void **g2_triangle** (int dev, double x1, double y1, double x2, double y2, double x3, double y3)

4.6.1 Function Documentation

4.6.1.1 void g2_arc (int *dev*, double *x*, double *y*, double *r1*, double *r2*, double *a1*, double *a2*)

Draw an arc.

Parameters:

dev device

x x coordinate of the center

y y coordinate of the center

r1 x radius

r2 y radius

a1 starting angle (in deg. 0-360)

a2 ending angle (in deg. 0-360)

4.6.1.2 void g2_circle (int *dev*, double *x*, double *y*, double *r*)

Draw a circle.

Parameters:

dev device

x x coordinate of the center

y y coordinate of the center

r radius

4.6.1.3 void g2_ellipse (int *dev*, double *x*, double *y*, double *r1*, double *r2*)

Draw an ellipse.

Parameters:

dev device

x x coordinate of the center

y y coordinate of the center

r1 x radius

r2 y radius

4.6.1.4 void g2_filled_arc (int *dev*, double *x*, double *y*, double *r1*, double *r2*, double *a1*, double *a2*)

Draw a filled arc.

Parameters:

dev device

x x coordinate of the center

y y coordinate of the center

r1 x radius

r2 y radius

a1 starting angle (in deg. 0-360)

a2 ending angle (in deg. 0-360)

4.6.1.5 void g2_filled_circle (int *dev*, double *x*, double *y*, double *r*)

Draw a filled circle.

Parameters:

dev device

x x coordinate of the center

y y coordinate of the center

r radius

4.6.1.6 void g2_filled_ellipse (int *dev*, double *x*, double *y*, double *r1*, double *r2*)

Draw a filled ellipse.

Parameters:

dev device

x x coordinate of the center

y y coordinate of the center

r1 x radius

r2 y radius

4.6.1.7 void g2_filled_polygon (int *dev*, int *N_pt*, double * *points*)

Draw a filled polygon.

Parameters:

dev device

N_pt number of points (Note: It is not size of *points* vector!)

points vector of coordinates: x1, y1, x2, y2, ...

4.6.1.8 void g2_filled_rectangle (int *dev*, double *x1*, double *y1*, double *x2*, double *y2*)

Draw a filled rectangle specified by the two opposite corner points.

Parameters:

dev device

x1 x coordinate of the 1st corner

y1 y coordinate of the 1st corner

x2 x coordinate of the 3rd corner

y2 y coordinate of the 3rd corner

4.6.1.9 void g2_filled_triangle (int *dev*, double *x1*, double *y1*, double *x2*, double *y2*, double *x3*, double *y3*)

Draw a filled triangle specified by the 3 corner points.

Parameters:

dev device

x1 x coordinate of the 1st corner

y1 y coordinate of the 1st corner

x2 x coordinate of the 2nd corner

y2 y coordinate of the 2nd corner

x3 x coordinate of the 3rd corner

y3 y coordinate of the 3rd corner

4.6.1.10 void g2_image (int *dev*, double *x*, double *y*, int *x_size*, int *y_size*, int * *pens*)

Draw a pen image

Parameters:

dev device

x x coordinate

y y coordinate

x_size x size

y_size y size

pens vector of x_size*y_size pens: p11, p21, ... pxy, ...

4.6.1.11 void g2_line (int *dev*, double *x1*, double *y1*, double *x2*, double *y2*)

Draw a line from `x1`, `y1` to `x2`, `y2`.

Parameters:

dev device

x1 see above

y1 see above

x2 see above

y2 see above

4.6.1.12 void g2_line_r (int *dev*, double *dx*, double *dy*)

Draw line relative to the graphic cursor.

Parameters:

dev device

dx relative x coordinate

dy relative y coordinate

4.6.1.13 void g2_line_to (int *dev*, double *x*, double *y*)

Draw line from graphic cursor to the point x, y

Parameters:

dev device

x x coordinate

y y coordinate

4.6.1.14 void g2_move (int *dev*, double *x*, double *y*)

Move graphic cursor.

Parameters:

dev device

x x coordinate

y y coordinate

4.6.1.15 void g2_move_r (int *dev*, double *dx*, double *dy*)

Move graphic cursor relative to the currner graphical cursor position.

Parameters:

dev device

dx x coordinate increment

dy y coordinate increment

4.6.1.16 void g2_plot (int *dev*, double *x*, double *y*)

Plot a point

Parameters:

dev device

x x coordinate

y y coordinate

4.6.1.17 void g2_plot_QP (int *dev*, double *x*, double *y*)

Quasi Pixel fake. Quasi pixel is introduced to make easier plotting of cellular automata and related pictures. QP is simple a big pixel as specified by **g2_set_QP()**(p. 20). Coordinates are skaled accordingly, so no recalculation is needed on client side.

Parameters:

dev device

x x coordinate

y y coordinate

4.6.1.18 void g2_plot_r (int *dev*, double *rx*, double *ry*)

Plot a point relative to graphical cursor.

Parameters:

dev device

rx relative x coordinate

ry relative y coordinate

4.6.1.19 void g2_poly_line (int *dev*, int *N_pt*, double * *points*)

Draw a poly line.

Parameters:

dev device

N_pt number of points (Note: It is not size of *points* vector!)

points vector of coordinates: x1, y1, x2, y2, ...

4.6.1.20 void g2_polygon (int *dev*, int *N_pt*, double * *points*)

Draw a polygon.

Parameters:

dev device

N_pt number of points (Note: It is not size of *points* vector!)

points vector of coordinates: x1, y1, x2, y2, ...

4.6.1.21 void g2_rectangle (int *dev*, double *x1*, double *y1*, double *x2*, double *y2*)

Draw a rectangle specified by the two opposite corner points.

Parameters:

dev device

x1 x coordinate of the 1st corner

y1 y coordinate of the 1st corner

x2 x coordinate of the 3rd corner

y2 y coordinate of the 3rd corner

4.6.1.22 void g2_string (int *dev*, double *x*, double *y*, const char * *text*)

Draw string, see also **g2_set_font_size()**(p. 20).

Parameters:

dev device

x x coordinate

y y coordinate

text null terminated string

4.6.1.23 void g2_triangle (int *dev*, double *x1*, double *y1*, double *x2*, double *y2*, double *x3*, double *y3*)

Draw a triangle described by 3 corner points.

Parameters:

dev device

x1 x coordinate of the 1st corner

y1 y coordinate of the 1st corner

x2 x coordinate of the 2nd corner

y2 y coordinate of the 2nd corner

x3 x coordinate of the 3rd corner

y3 y coordinate of the 3rd corner

4.7 virtual device related functions

Functions

- int **g2_open_vd** (void)
- void **g2_attach** (int vd_dev, int dev)
- void **g2_detach** (int vd_dev, int dev)

4.7.1 Detailed Description

Virtual device is a method to redirect g2 output to multiple devices. Here is an example:

```
int d1 = g2_open_X11(100, 100);      create first X11 window
int d2 = g2_open_X11(100, 100);      create 2nd X11 window

int vd = g2_open_vd();               open a new virtual device

g2_attach(vd, d1);                   attach d1 (1st window) to virtual device
g2_attach(vd, d2);                   attach d2 (2nd window) to virtual device

g2_plot(d1, 11, 11);                 output to the 1st X11 window
g2_plot(d2, 12, 12);                 output to the 2nd X11 window
g2_plot(vd, 13, 13);                 output to both X11 windows
```

4.7.2 Function Documentation

4.7.2.1 void g2_attach (int *vd_dev*, int *dev*)

Attach a device to virtual device *vd_dev*.

Parameters:

vd_dev virtual device (create virtual device by calling **g2_open_vd()**(p. 30)) ă

dev device

4.7.2.2 void g2_detach (int *vd_dev*, int *dev*)

Dettach a device from the virtual device *vd_dev*.

Parameters:

vd_dev virtual device ă

dev device

4.7.2.3 int g2_open_vd (void)

Create a new virtual device.

Returns:

virtual device ID

4.8 GD

Enumerations

- enum **g2_gd_type** { **g2_gd_jpeg** = 0, **g2_gd_png** = 1, **g2_gd_gif** = 2 }

Functions

- int **g2_open_gd** (const char *filename, int width, int height, enum **g2_gd_type** gd_type)

4.8.1 Enumeration Type Documentation

4.8.1.1 enum g2_gd_type

g2 gd bitmap types

Enumerator:

g2_gd_jpeg jpeg

g2_gd_png png

g2_gd_gif gif

4.8.2 Function Documentation

4.8.2.1 int g2_open_gd (const char * *filename*, int *width*, int *height*, enum g2_gd_type *gd_type*)

Create a GD (bitmap image) device.

Parameters:

filename output file name

width width

height height

gd_type file type, see **g2_gd_type**(p. 31)

Returns:

physical device id

4.9 PostScript

Enumerations

- enum **g2_PS_paper** {
  g2_A0, **g2_A1**, **g2_A2**, **g2_A3**,
  g2_A4, **g2_A5**, **g2_A6**, **g2_A7**,
  g2_A8, **g2_A9**, **g2_B0**, **g2_B1**,
  g2_B2, **g2_B3**, **g2_B4**, **g2_B5**,
  g2_B6, **g2_B7**, **g2_B8**, **g2_B9**,
  g2_B10, **g2_Comm_10_Envelope**, **g2_C5_Envelope**, **g2_DL_Envelope**,
  g2_Folio, **g2_Executive**, **g2_Letter**, **g2_Legal**,
  g2_Ledger, **g2_Tabloid** }
- enum **g2_PS_orientation** { **g2_PS_land**, **g2_PS_port** }

Functions

- G2L int **g2_open_PS** (const char *file_name, enum **g2_PS_paper** paper, enum **g2_PS_orientation** orientation)
- G2L int **g2_open_EPSF** (const char *file_name)
- G2L int **g2_open_EPSF_CLIP** (const char *file_name, long width, long height)

4.9.1 Enumeration Type Documentation

4.9.1.1 enum g2_PS_orientation

g2 paper orientation.

Enumerator:

g2_PS_land landscape

g2_PS_port portrait

4.9.1.2 enum g2_PS_paper

g2 paper type.

Enumerator:

g2_A0 A0 2384 x 3370

g2_A1 A1 1684 x 2384

g2_A2 A2 1191 x 1684

g2_A3 A3 842 x 1191

g2_Legal Legal 612 x 1008
g2_Ledger Ledger 1224 x 792
g2_Tabloid Tabloid 792 x 1224

4.9.2 Function Documentation

4.9.2.1 G2L int g2_open_EPSF (const char * *file_name*)

Create an encapsulated PS device.

Parameters:
file_name postscript file name

Returns:
physical device id

4.9.2.2 G2L int g2_open_EPSF_CLIP (const char * *file_name*, long *width*, long *height*)

Create an encapsulated PS device with clipping.

Parameters:
file_name postscript file name
width clipping region width
height clipping region height

Returns:
physical device id

4.9.2.3 G2L int g2_open_PS (const char * *file_name*, enum g2_PS_paper *paper*, enum g2_PS_orientation *orientation*)

Create a PS device.

Parameters:

file_name postscript file name

paper paper type, see **g2_PS_paper**(p. 32) and appendix Appendix

orientation paper orientation, see **g2_PS_orientation**(p. 32)

Returns:

physical device id

4.10 MS Windows

Enumerations

- enum **g2_win32_type** { **g2_win32**, **g2_wmf32** }

Functions

- int **g2_open_win32** (int width, int height, const char *title, int type)

4.10.1 Enumeration Type Documentation

4.10.1.1 enum g2_win32_type

Window type

Enumerator:

g2_win32 regular window

g2_wmf32 windows meta file

4.10.2 Function Documentation

4.10.2.1 int g2_open_win32 (int *width*, int *height*, const char * *title*, int *type*)

Create a Windows device.

Parameters:

width window width

height window height

title window title

type window type, see **g2_win32_type**(p. 35)

Returns:

physical device id

4.11 X11

Functions

- int **g2_open_X11** (int width, int height)
- int **g2_open_X11X** (int width, int height, int x, int y, char *window_name, char *icon_name, char *icon_data, int icon_width, int icon_height)

4.11.1 Function Documentation

4.11.1.1 int g2_open_X11 (int *width*, int *height*)

Open a simple X11 window (physical device device).

Parameters:

width window width

height window height

Returns:

physical device id

4.11.1.2 int g2_open_X11X (int *width*, int *height*, int *x*, int *y*, char * *window_name*, char * *icon_name*, char * *icon_data*, int *icon_width*, int *icon_height*)

Open a X11 window (physical device device). If *icon_width* or *icon_height* is smaller than 0, the *icon_data* is interpreted as a file name.

Parameters:

width window width

height window height

x x position on screen

y y position on screen

window_name hint for window manager

icon_name hint for window manager

icon_data icon bitmap (*icon_width* * *icon_height* bits) or file name containing bitmap (if *icon_width* <= 0 or *icon_height* <= 0)

icon_width icon width

icon_height icon height

Returns:

physical device id

4.12 g2 User Interface

Modules

- color manipulations
- output control
- devices control
- graphical output
- virtual device related functions
- g2 Physical devices

4.13 g2 Physical devices

Modules

- **FIG**
- **GD**
- **PostScript**
- **MS Windows**
- **X11**

4.13.1 Detailed Description

g2 physical devices are drivers for different output formats.
